The **Non-Searchable Encryption - Length Preserving** scheme encrypts medium-length text content. This scheme is non-deterministic in nature, so users can’t search this content. This scheme has comparable security to Standard Encryption.

**IMPORTANT:** This encryption scheme is very slow. We recommend that you use the [Standard Encryption with Compression Encoding scheme](https://success.myshn.net/Policy/Encryption/Encryption_Schemes/Standard_Encryption_with_Compression_Encoding_scheme) instead. If you are currently using this scheme, you should consider migrating to the Standard Encryption with Compression Encoding Scheme in the future.
